

Credit Card Approval Prediction – Problem Statement

Introduction:

Credit cards are important financial tools that help customers manage payments and expenses. Banks need an efficient method to decide whether an applicant is eligible for a credit card.

Problem:

Traditional credit card approval processes require manual verification and take more time. Incorrect decisions may lead to financial risks for banks.

Objective:

The main objective of this project is to develop a machine learning model that predicts credit card approval based on applicant information.

Need for the System:

An automated prediction system helps banks reduce processing time and improve accuracy. It supports faster and smarter decision-making.

Proposed Solution:

A machine learning model is trained using previous applicant data. The model analyzes customer details and predicts approval or rejection status.
