

Requirement Analysis – Credit Card Approval Prediction

Introduction:

Requirement analysis identifies the needs and expectations of the project. It helps in understanding the functions required to build the system.

Functional Requirements:

The system should accept customer details such as income, age, employment status, and credit history. It should process the information and provide approval prediction results.

Non-Functional Requirements:

The system should be easy to use, reliable, and provide results quickly. It should maintain accuracy and handle information securely.

User Requirements:

Users need a simple interface where they can enter applicant details. The system should display approval or rejection results.

System Requirements:

The project requires Python environment and machine learning libraries. A dataset is needed for training and testing.

Expected Outcome:

The final system should predict credit card approval status accurately and reduce manual effort.
