

Technology Stack – Credit Card Approval Prediction

Programming Language:

Python is used for developing the machine learning model and application. It provides various libraries for data analysis and prediction.

Machine Learning:

Machine learning algorithms identify patterns from previous credit card application data. The trained model predicts future approval decisions.

Data Processing:

Pandas and NumPy are used for handling and analyzing datasets. Data preprocessing improves input data quality.

Model Development:

Scikit-learn is used for building and training the prediction model. Different algorithms can be evaluated for better performance.

User Interface:

A simple application interface allows users to enter details and view prediction results.

Development Tools:

Tools like Jupyter Notebook, VS Code, and Python environment support coding and testing.
