

Customer Journey Map – Credit Card Approval Prediction

Stage 1: Customer Need:

Customers apply for credit cards based on financial requirements. They expect a simple and quick approval process.

Stage 2: Application Submission:

The customer provides personal and financial details required for evaluation. The system collects these details for prediction.

Stage 3: Data Analysis:

The machine learning model analyzes customer information. It identifies patterns from previous application data.

Stage 4: Prediction Result:

The system provides approval status based on the trained model. Customers receive faster results.

Stage 5: Feedback:

Users can evaluate system performance and provide feedback. Continuous improvement increases accuracy.

Benefits:

The customer journey becomes faster and easier. Banks can process applications efficiently with reduced workload.
